

Purify Solution™'s Combustion Purifier™: A Revolutionary Emissions Cleaning Device

Palo Alto, CA—October 5, 2006: Purify Solutions™ (www.purifysolutions.com) is pleased to announce the release of its new product, the Combustion Purifier™, a revolutionary patent-pending emissions control device that combines and exceeds the capabilities and functionality of a catalytic converter, a muffler, and a particulate trap and is applicable to automobile, truck, heavy equipment, marine engines, stationary power plants, furnaces and fireplaces, whether they are fired by gasoline, Diesel, residual oil, wood or even coal. The Combustion Purifier™ is the only device that enables complete compliance with and exceeds the requirements of the upcoming emissions control regulations, especially the 2007 EPA Diesel Truck and CARB Level III emissions standards. The Combustion Purifier™ reduces engine backpressure, fuel consumption and carbon dioxide (CO₂) emissions by 10%, and NO_x, SO_x, particulate, hydrocarbon, carbon monoxide and other tailpipe emissions by over 95%. These reductions are expected to save the lives of 25,000 people who die of respiratory disease each year in California alone.

The Combustion Purifier™ is the perfect solution to pollution: It cleans the air we breathe and also generates additional profits for our customers.

About Purify Solutions™

Purify Solutions, Inc., is a privately-held clean tech company providing global solutions that favorable impact both the environment and the economics of their deployed industries. More information regarding Purify Solutions, Inc., is available at <http://www.purifysolutions.com/>.
